TITLE: The Design of Truss Systems by the Triangle Method (Raschet sterzhnevyykh sistem sposobom treugol'nikov)

PERIODICAL: Zap. Leningr. zaoch. industr. in-ta, Leningrad, LGU, 1955,
pp 23-53

ABSTRACT: The method for the design of a plane truss system involves two principal unknown factors, namely, the relative elongations of the members and the linear displacements of the supports. The triangle method combines the fairly unsuccessful versions of the method of displacements and the method of fixed points. Certain steps in the computations require additional investigation. The triangle method does not offer any advantages over the known methods of designing truss systems.

TITLE: The Strength of the Terminal Coupling Link of an Anchor Chain
in the Elastic and the Plastic Range (Raschet na prochnost'
kontsevogo soyedinitel'nogo zvena yakornoy tsepi v uprugoy i
plasticheskoy stadii)

PERIODICAL: Tr. Leningr. korablestroit. in-ta, 1955, Vol 16, pp 60-75

ABSTRACT: Examination of the terminal coupling link of a chain, equipped
with a stud link. The calculation is based on a schematic non-
hinged semicircular arch with clamped ends. The loading is
assumed to be uniformly distributed over a 90-degree apex angle.
The following loads were investigated: 1) the load that causes
the phenomenon of creep; 2) the load that corresponds to the
formation of plastic hinging; and 3) the rupture load. It is
noted that the computed rupture load agrees quantitatively with
that determined experimentally (within 3.5%).

Iskritskiy, Dmitriy Yevgen'yevich

Ustalost' metallov v konstruktsiyakh (Fatigue of Metals in Constructions) Moscow, Fizmatgiz, 1960. 85 p. 15,000 copies printed.

Ed.: G.I. Fel'dman; Tech. Ed.: I.Sh. Aksel'rod.

PURPOSE: This booklet is intended for workers, foremen, technicians, and students in secondary technical schools who are studying the problem of the calculation of machine parts for strength.

COVERAGE: Certain problems dealing with fatigue strength are discussed in easy-to-understand language. Particular attention is given to cyclic alternating stresses which contribute to the formation of fatigue cracks and fractures. A large number of examples are given which interpret fatigue as a cause of accidents in various branches of engineering. Briefly described are several machines for the fatigue testing of parts, certain methods for the early detection of fatigue cracks, and means for the prevention of fatigue fractures in machine parts. No personalities are mentioned. There are no

ORG: Kola Branch, AN SSSR (Kol'skiy filial AN SSSR)

TITLE: Problems in developing large-panel prefabricated home building in Murmansk Oblast

SOURCE: AN SSSR. Komissiya po problemam severa. Problemy severa, no. 10.
1964, 40-50TOPIC TAGS: general construction, cost estimate, industrial development, cement,
construction material, mineral, economic development, structural engineering, laborABSTRACT: Experience shows that 10 to 15% in costs and 30 to 40% in labor
can be saved by using prefabricated large-panel home construction instead of
on-site piecemeal construction. Home-building forecasts in Murmansk Oblast
indicate continuing increases, ranging from 220,000 m² in 1962 to 900,000 m²
annually in the period from 1970 to 1980. Labor costs at the edge of the
Arctic Circle are almost 80% greater than in the mid-latitudes of the USSR,
and over-all costs tend to rise even more due to the severe climatic conditions
when piecemeal construction methods are used. The suggested prefabrication
techniques require the solution of problems involved in building the large
panels and in finding effective building and thermal insulation materials.

Card 1/3

1526

L 32902-66

ACC NR: AT6023833

These problems can either be assigned to the home-building activities in Leningrad and Moscow, or by organizing production centers in Murmansk Oblast'.

Advantages of developing this industry in Murmansk include the production of portland cement from the byproducts of double superphosphate manufacture. Also, Murmansk has one of the largest deposits of vermiculite in the Soviet Union. Large local deposits of other materials can provide adequate supplies for silicate manufactures, thereby eliminating the expense of transportation. Comparative cost tables are given for various materials manufactured in the three suggested regions, showing that although initial manufacturing costs are higher in Murmansk than in Leningrad or Moscow, transportation costs invariably make the latter's materials more expensive by 42 and 59% respectively.

To achieve the norm of 12 m² per person, 12 million m² of housing is required, which means that 8.2 million m² must be built, as well as 1.9 million m² of public buildings. Murmansk Oblast' has the potential of prefabricating large-scale panels for 70 thousand m² of housing, while Apatitstroy Trust has the potential of 35 thousand m². Costs at these shops is high owing to considerable hand-work required in the production of large reinforced concrete panels, vermiculite-filled joists and beams, aerated concrete insulation, cinderblock, foamed glass, and semirigid slag plates.

Comparative current and projected production figures are given for several regions, and economic factors and costs involved in various pre-fabricated designs are discussed in detail. Establishment of adequate

Card 2/3

L 32902-66

ACC NR: AT6023833

prefabricated housing plant facilities in Murmansk would cost 35% more
(497 thousand rubles) than equal facilities in the mid-latitudes of the
USSR, but this capital outlay would be returned within 5 to 7 months by
the savings realized in comparison with costs of supplying the necessary
construction materials from Moscow and Leningrad. Orig. art. has: 5 tables.

TITLE: On Drafting Tools, Slide Rules (Oschertechnom instrumente, schetnoy lineyke)

PERIODICAL: Mashinostroitel', 1958, # 3, p 40 (USSR)

ABSTRACT: The author complains of the scarcity of drafting tools for sale in the USSR, and of the poor quality of slide rules. It is not always possible to find such drafting aids as a compass. Most textbooks on drafting say nothing of such tools and none of the new tools described in the official invention index "Measuring Tools and Devices" are being produced.

TITLE: Superassociations in remote galaxies

CITED SOURCE: Soobshch. Byurakansk. observ., vy*ii, 33, 1963, 3-13

TOPIC TAGS: stellar association, stellar superassociation, galaxy, irregular galaxy, Large Magellanic Cloud, Small Magellanic Cloud, Ursa Major, supergiant, nebula

TRANSLATION: The complex 30 Dor in the Large Magellanic Cloud considerably exceeds other associations in luminosity ($M = -15^m.0$) and diameter (600 parsecs). The authors assign it to a special class of objects — superassociations. Searches have been made for superassociations in distant galaxies on photographs taken with the use of a 21" Schmidt reflector. Data are presented which were obtained in a study of 68 galaxies from the Shapley-Ames catalogue, mostly of type Sc and with known radial velocities. In the determination of absolute values it was assumed that $H = 75$ km/sec·Mps. Superassociations have been discovered in 12 galaxies; in most cases these are supergiant

Card 1/2

L 18386-65

ACCESSION NR: AR4040393

galaxies with $M - 20^m.5$. Often one galaxy contains several superassociations. The luminosity of the latter is less than the luminosities of galactic centers and superassociations are bluer than galactic centers. Superassociations are also found in irregular galaxies. Maps of the Palomar Atlas were also used for finding superassociations. A review of 250 objects with known radial velocities from the Shapley-Ames catalogue, after exclusion of 100 galaxies with overexposed images, made it possible to detect superassociations in 21 galaxies. In addition, superassociations were discovered in 13 of the 137 galaxies with diameters exceeding $1' +$ in the cluster in Ursae Major. In estimating the lower boundary of the age of the complex 30 Dor from the diameter of the complex and the velocity of expansion ($6 \cdot 10^7$ years) the authors conclude that during the period of development of the complex some ten generations of supergiants should have appeared in it and thousands of stars of high luminosity should have developed. The authors speculate on the mechanism of development of stars and nebulae in the Large and Small Magellanic Clouds and postulate that the stars and nebulae develop in associations and superassociations jointly from prestellar bodies whose nature is, for the time being, unknown. When the transplantation of Ehrlich mouse ascites tumour was carried out in newborn rats it was successfully transferred for 8 passages but then died out in the rats though it was still positive in mice for one further generation. It never grew in adult rats though tested at every passage. The authors attribute their results to the undeveloped immune system in immature animals. There was evidently some factor which vitiated the tumour cells since it eventually died out instead of continuing indefinitely.

Abstract : Rabbits were immunized with spleen tissue of dogs. The resulting serum was injected into mice which had received transplants of pieces of adrenal cortex (A) and sexual glands from dog embryos. Control animals with transplants of A died within 3-4 days, while 60% of the test animals survived. After 1-2 months the transplants had the usual form of normal A tissue.

ABSTRACT : 83 mice and 43 albino rats were subjected
to grafting of heterotransplants of spleen tissue of
animals of other phylogenetic groups. The authors found
that heterotransplants taken from mammals died, while the
spleen tissues taken from hens and tritons retained their
viability for a long time and formed an organ. The ex-
periments emphasize the important role of the factors of
assimilation and adaptation in shaping the fate of the
heterotransplants.

"Investigations on the Effect of Devincan on the Cerebral Circulation, Venous Pressure in the Brain and Oxygen Consumption of the Brain in Humans."

Budapest, Kiserletes Orvostudomany, Vol XV, No 3, June 1963, pp 284-286.

Abstract: [Authors' Hungarian summary] The effect of Devincan on the circulation and oxygen consumption of the brain has been studied on 11 (mostly hypertensive) patients. After administration of Devincan, in addition to a moderate lowering of the blood pressure, the blood flow in the brain increased somewhat and the resistance of the brain vessels decreased. The venous pressure change was not uniform, but decreased slightly in the majority of the cases studied. Oxygen consumption of the brain was virtually unchanged. As a result of the study, the authors advocate an attempt for the therapeutic use of Devincan in cases of hypertension complicated by cerebral circulation disturbances. 2 Hungarian, 3 Western references.

"Experimental Investigations on the Effect of Hypoxia on the Coronary Circulation in Dogs."

Budapest, Kiserletes Orvostudomany, Vol XV, No 3, June 1963, pp 295-299.

Abstract: [Authors' Hungarian summary] The mechanism of the changes occurring in the coronary circulation due to hypoxia has been studied by means of an isolated cerebral and isolated trunk hypoxia in crossed circulation experiments on dogs. Isolated trunk hypoxia results in a definite increase of the coronary circulation and decrease of the resistance of the coronary vessels. During isolated cerebral hypoxia, a reflex coronary spasm is observed which is followed after the hypoxia by a reflex coronary dilation of central origin. 4 Western, 4 Hungarian references.

"The Effect of Hypoxia on Coronary Blood Flow"

Budapest, Acta Physiologica Academiae Scientiarum Hungaricæ, Supplement to Vol 22, 1963; p 10.

Abstract [Authors' English summary]: In dogs with crossed circulation and isolated perfusion of the head, the effect on coronary circulation of isolated cerebral and isolated trunk hypoxia has been studied. In response to isolated cerebral hypoxia, coronary flow decreased and coronary resistance significantly increased. After the relief of hypoxia coronary dilatation with a significant diminution of coronary resistance occurred. Under isolated trunk hypoxia coronary flow was considerably increased and coronary resistance decreased. Cardiac output increased slightly in isolated cerebral hypoxia, and significantly in isolated trunk hypoxia. Blood pressure increased significantly in both cases.

"Effect of Hypoxia on Venous Pressure in the Brain"

Budapest, Acta Physiologica Academiae Scientiarum Hungaricæ, Vol 23, No 1, 1963, pp.9-12.

Abstract: [English article; authors' English summary] Acute hypoxia has been found to be followed first by an increase in venous tone and then by a rise in cerebral and systemic venous pressure. These phenomena subsided after the termination of hypoxia. Administration of Dibenamine prevented the hypoxic increases of both venous tone and venous pressure. Twelve references, including 3 Hungarian, 4 German, and 5 Western.

TITLE: Effect of an acute increase in cardiac output on cerebral and peripheral blood flow /This paper was presented at the 29th Meeting of the Hungarian Physiological Society held in Szeged from 2 to 4 July 1967

SOURCE: Academia scientiarum hungaricae. Acta physiologica, v. 26, Supplement,
1965, 43-44

TOPIC TAGS: dog, cardiovascular system, cerebrum, radionuclides

ABSTRACT:

In response to an acute increase in cardiac output (induced by a rapid infusion of a physiological NaCl solution, 10 ml/kg) in the dog, the blood flow in the internal carotid and the vertebral artery increased moderately while that in the femoral artery increased greatly, as determined with a floating rotameter. According to results of clinical experiments, the acute increase in cardiac output on

Card 1/2

L 15477-56

ACC NR: AT6007436

the infusion of 5 ml/kg saline significantly increased the cerebral and peripheral blood flow. The oxygen and glucose uptake by tissues of the brain and extremities increased, cerebral vascular resistance decreased slightly, vascular resistance in the extremities diminished markedly. The cerebral fraction of cardiac output decreased slightly while the peripheral fraction increased. The venous isotope dilution method was used for the latter determinations. [JPRS]

TITLE: Evaluating the work capacity of greases used in ball bearings

SOURCE: Metody otsenki ekspluatatsionnykh svoystv reaktivnykh topliv i smazochnykh materialov (Methods for the performance evaluation of jet propellants and lubricants). Moscow, Izd-vo Mashinostroyeniye, 1966, 118-125

TOPIC TAGS: lubricant, ball bearing, grease

ABSTRACT: Experimental data are given on a new method for comparative evaluation of the work capacity of greases used in high-speed closed roller bearings operating at temperatures below 350°C. Duration of normal bearing operation is used as the criterion for evaluating the work capacity of the lubricants. The point of binding is assumed as the breakdown point of normal bearing operation. Binding is characterized by disruption of smooth bearing operation and by a significant temperature increase in the external ring. TVP180506BT3 ball bearings were tested on the IS-9 unit. Several bearings belonging to a single precision class were used for each testing stage. These bearings were washed in benzene and acetone before testing, and the clearances between the rings and separators were filled with the lubricant to be tested. 1.5 and

Title : Parotid Gland and Auricular Ganglion in Man

Orig Pub : Sb. nauchn. tr. Tashkentak gos. med. in-ta, Tashkent,
AN, UzSSR, 1957, 486-489.

Abstract : The structure of the parotid gland (PG) and of the auricular ganglion is subject to variation during growth. In embryos and fetuses, PG consists of undifferentiated glandular elements. The stroma predominates over the parenchyma. Towards the 8th month, there is an increase in the relative content of the glandular elements. In the first months of life, both the size of glandular vesicles and the caliber of ducts increase. In the 6-7-month old child, the parotid gland resembles that of the adult. In
